When a data breach occurs, you need answers—fast: how did it happen, who is affected and what are the risks. Whatever the cause—a malicious attack, third-party mistake, a system glitch or simple human error—timely forensic analysis can help you contain the damage and determine the scope of the breach.

The Solution: ID Experts Digital Forensic Investigation
Our digital forensic professionals are experts in collecting, analyzing, and processing computer data in a way that reduces costs and minimizes disruption to your organization.

Our services include:

- **Collection** — We employ defensible methodologies to acquire and secure data in its original digital medium so that evidence is not lost or compromised. Plus, we inventory and establish a chain of custody to track original media in case it is needed in legal proceedings.

- **Data Extraction** — We create a forensically sound image of the original media for analysis, produce a backup copy of the data and store all evidence in a secure location.

- **Identification** — Using forensic tools, we identify evidence relating to a specific incident, and determine if there have been successful or partially successful attempts to destroy evidence, as well as if there are other sources of evidence that require acquisition.

- **Analysis** — We analyze the relevant data to determine the data types that are involved, the nature of the breach, the level of exposure, and whether or not the data was sent from or to a third party. We also analyze the facts to provide a comprehensive assessment of the overall risks and implications for your organization.

- **Documentation** — We record our steps and publish our findings in defensible, easy-to-read formats, including case reports. Our preservation, analysis and opinions have been specifically upheld by courts and law enforcement agencies, and depending upon the nature of the situation, we are able to work under attorney-client privilege.

- **Aid in Notification** — We use sampling and modeling techniques to quickly pull notification data from large, often disorganized databases. Our expertise in this area allows the work to be done easier, more accurately, and more cost effectively than going it alone or relying on forensic-only companies.

Malware Identification and Analysis
If you’re the victim of a cyber attack, our experts can identify the specific malware infecting your system, as well as determine what data was exposed. This frees up your IT department to focus on other critical tasks.

We have completed digital forensic analysis investigations for businesses, hospitals, law firms, and universities. Our forensic experts use scientific methods to get to the root cause of the data breach, contain the issue, and analyze and document the findings, while minimizing the impact on your organization.
